Talking to patients about COVID-19 vaccines

This document is designed to assist health professionals treating Aboriginal and Torres Strait Islander patients to answer their questions about the COVID-19 vaccines.

- COVID-19 can cause very serious illness, especially for the elderly and those in our community who have existing medical conditions. Through the pandemic there have been more than 145,000 cases in Australia, with more than 4,800 cases among Aboriginal and Torres Strait Islander people (as at 18 October 2021).

- COVID-19 vaccines are free for everyone in Australia and are the best way of protecting you, your family and the community from getting very sick from COVID-19.

- Australia has three COVID-19 vaccines – Vaxzevria (AstraZeneca), Comirnaty (Pfizer) and Spikevax (Moderna). We know that these vaccines are incredibly effective at preventing severe illness and death from COVID-19. There is also promising evidence that the vaccines are likely to substantially reduce the chance of transmitting the virus to others.

- The Pfizer vaccine is approved for people aged 12 years and over. The Pfizer vaccine requires two doses to be most effective, given between 3 and 6 weeks apart. It is most effective when given 3 weeks apart.

- The Moderna vaccine is approved for people aged 12 years and over. The Moderna vaccine requires two doses to be most effective, given between 4 and 6 weeks apart.

- The AstraZeneca vaccine approved for people aged 18 years and over. The AstraZeneca vaccine also requires two doses to be most effective, given between 4 and 12 weeks apart. It is most effective when given 12 weeks apart.

- Current evidence from clinical trials indicates that Australia’s approved COVID-19 vaccines are likely to provide protection from a variety of variants of the COVID-19 virus. This information is still emerging and being closely monitored.

- When enough people in the community are vaccinated, it slows down the spread of the virus. With lots of people vaccinated, we rarely see the deadly diseases that vaccines prevent (including diphtheria, measles and meningococcal).

For more information

For more detailed information, download the ‘Information to assist healthcare workers talk to Aboriginal and Torres Strait Islander people about COVID-19 vaccines’ document.

Clinical information about COVID-19 vaccines can be found on the Department of Health website.
