### Key messages

- In Australia, children receive vaccines against serious diseases under the National Immunisation Program. They receive these vaccines at key ages (called schedule points): 2, 4, 6, 12 and 18 months, and 4 years.
- The AusVaxSafety system actively monitors vaccine safety throughout Australia. Clinics send SMS messages to parents and carers to ask if their child had any reactions after receiving a vaccine. These reactions are called adverse events.
- Independent experts keep track of the responses from parents and carers.
- Between November 2016 and December 2017, SMSs were sent after almost 80,000 vaccination encounters. Almost 60,000 responses were received.
- 87% of parents and carers reported that their child did not have any adverse events.
- 13% of parents and carers reported an adverse event after immunisation.
  Some of these were events that were not related to the vaccination, such as 'a cold'.
- A very small percentage (1.3%) of parents or carers took their child to a doctor or emergency department in the days after vaccination.
- The most common adverse events after immunisation at 2, 4, 6 and
  12 months were irritability and fever.
- The most common adverse events after immunisation at 18 months and
  4 years were redness, swelling or pain at the injection site.
- These types of common adverse events are known to occur after vaccination. They are generally mild and go away within a few days.
- The results confirm that vaccines in the National Immunisation Program are very safe.

## What is AusVaxSafety?

<u>AusVaxSafety</u> is a national system for monitoring vaccine safety in Australia. The system is led by the <u>National Centre for Immunisation Research and Surveillance</u>. It is funded by the Australian Government Department of Health.

The AusVaxSafety system involves a range of collaborators around Australia.

### What does AusVaxSafety do?

AusVaxSafety tracks vaccine safety through:

- SMS responses from parents and carers
- data from specialist immunisation clinics through the <u>Adverse Events Following</u> Immunisation – Clinical Assessment Network (AEFI-CAN)
- data from general practices through the NPS MedicineInsight program

### Who does AusVaxSafety report to?

AusVaxSafety sends regular reports on vaccine safety to:

- the Australian Government Department of Health
- the Therapeutic Goods Administration
- other key stakeholders, such as state and territory health departments

## How AusVaxSafety works

A few days after a child receives a vaccine, their immunisation clinic sends an SMS message to their parent or carer. The SMS asks whether the child had any reactions in the days after vaccination. Parents and carers can respond 'Yes', 'No', or 'Stop' to opt out.

Parents and carers who respond 'Yes' receive a short survey to describe the adverse event.

AusVaxSafety monitors the responses closely. This means that any potential problems with vaccines can be seen and acted on early.

The responses are 'de-identified' to protect privacy. Any information that could identify the person sending the response or their child is removed.

In 2016–17, 175 immunisation clinics around Australia sent SMS messages to parents or carers after their child's vaccination (Figure 1). These included general practices, hospitals, community clinics and Aboriginal Medical Services.

The following pages show how parents and carers responded to the SMS at each schedule point in the National Immunisation Program (NIP). The NIP Schedule changes over time based on expert clinical advice. Check the Department of Health website for the latest NIP Schedule.

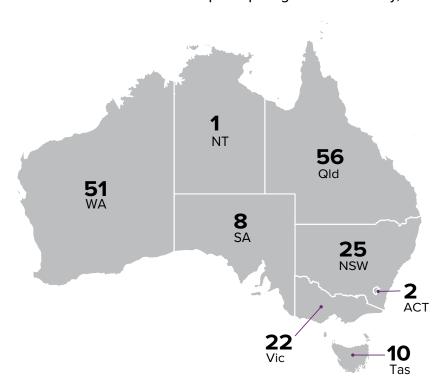

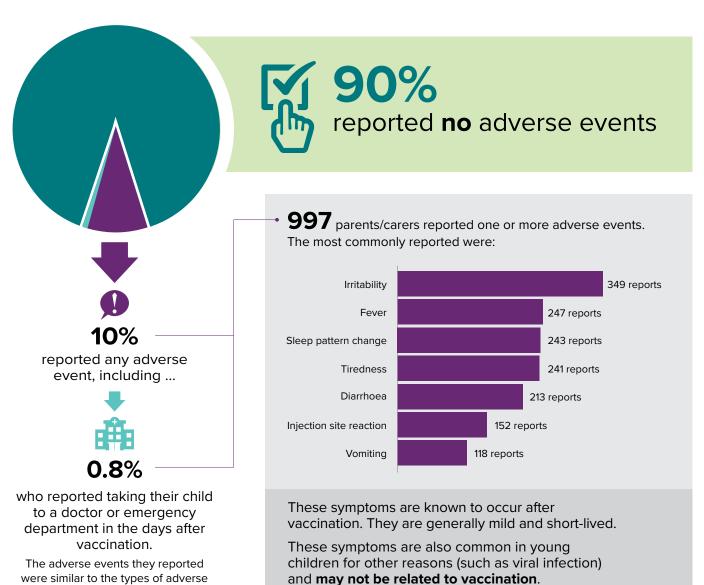

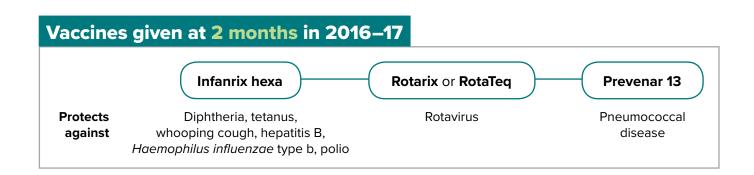

Figure 1 Number of immunisation clinics participating in AusVaxSafety, 2016–17

**10,326** parents/carers responded to an SMS about their child's health a few days after their 2-month vaccinations.

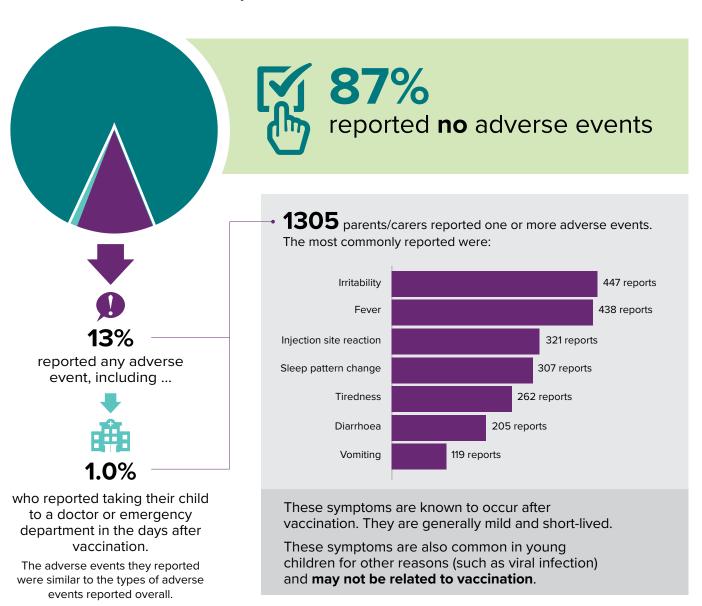

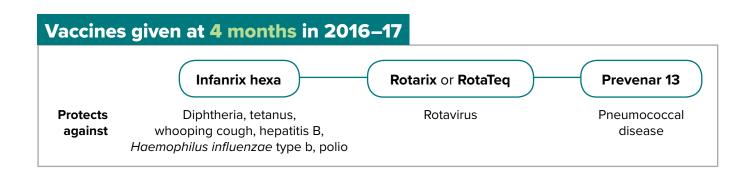

events reported overall.

**10,129** parents/carers responded to an SMS about their child's health a few days after their 4-month vaccinations.

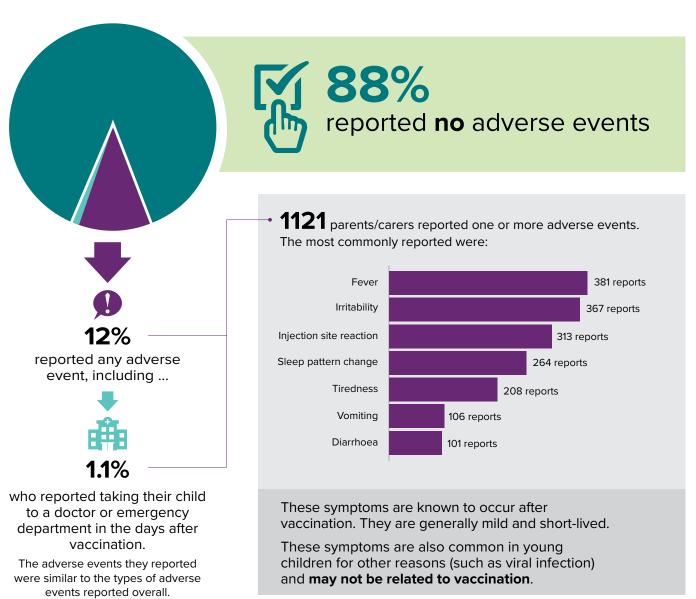

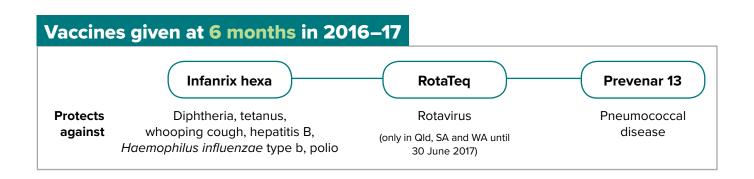

**9696** parents/carers responded to an SMS about their child's health a few days after their 6-month vaccinations.

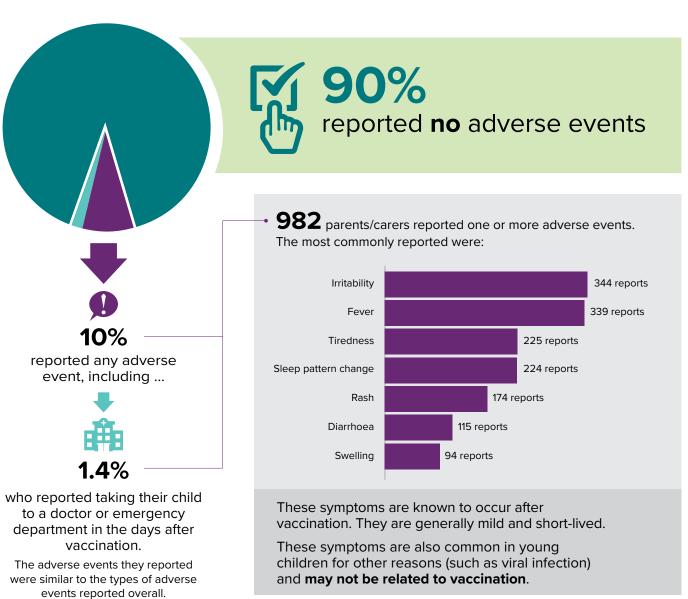

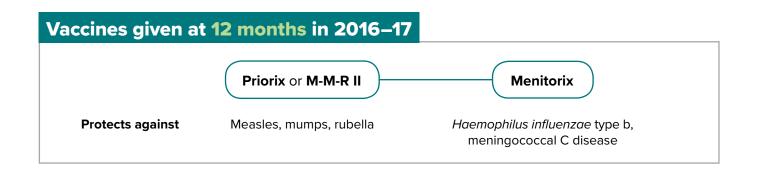

**10,225** parents/carers responded to an SMS about their child's health a few days after their 12-month vaccinations.

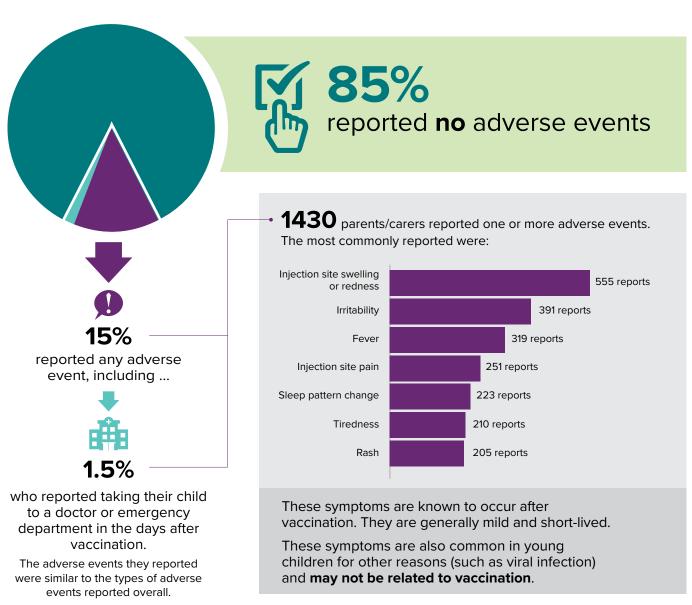

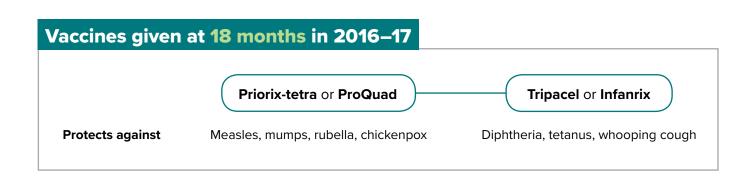

**9675** parents/carers responded to an SMS about their child's health a few days after their 18-month vaccinations.

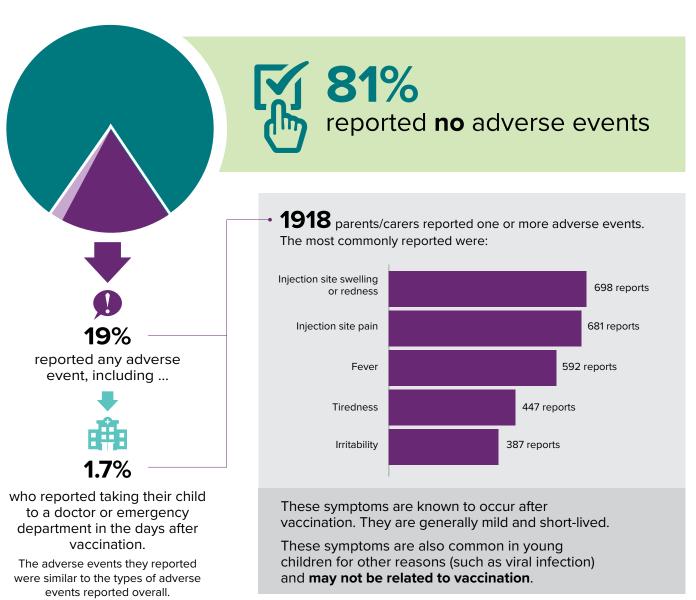

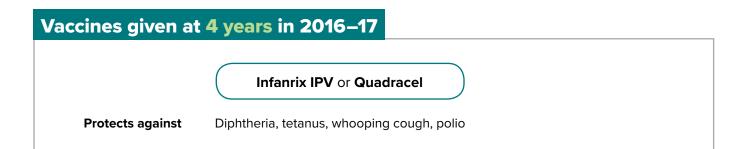

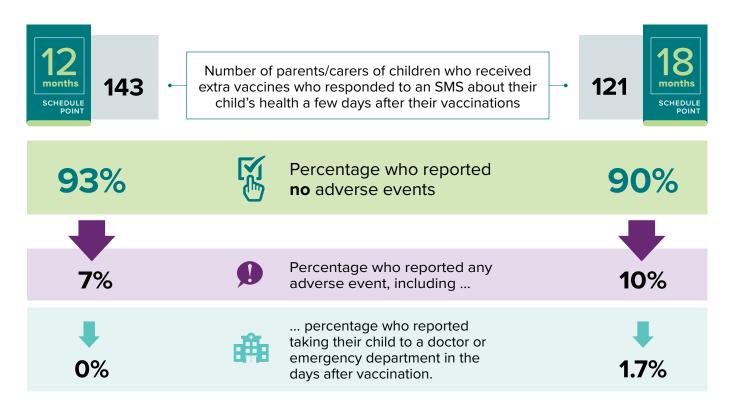

**9869** parents/carers responded to an SMS about their child's health a few days after their 4-year vaccinations.

# Extra National Immunisation Program vaccines for Aboriginal and Torres Strait Islander children

Aboriginal and Torres Strait Islander children receive hepatitis A vaccine and pneumococcal vaccine in addition to the routinely scheduled vaccines at 12 months and 18 months.

The most commonly reported adverse events were:
